WIP ASSEMBLY COMPLETION

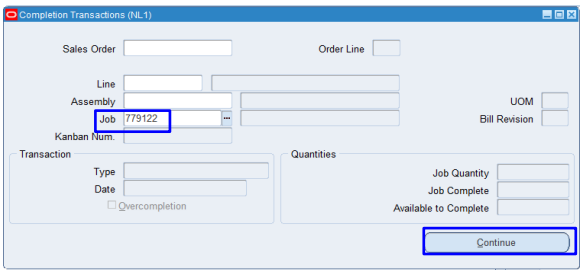
OSP Jobs are used for all Rework activities that are to be carried out by the Suppliers. These jobs can be for Reconfiguration (A to B) or Rework (A to A).

For such OSP Jobs, the WIP Assembly Completion transactions must be done, once the materials have been received again.

Note: WIP Assembly Completions for LS units should be processed for each unit separately. This can also be done using menu-option 'ZBR Assy Completion' on the Mobile Application. Each Serial Number that has passed the testing can be completed. Any units that have failed the final test must be adjusted against the job (e.g., scrap).

Step 1: Use responsibility 'ZTC Reconfiguration' or 'ZTC Reconfiguration Super User'
And navigate to 'Manufacturing' -> Material Transactions' -> 'Completion Transactions'

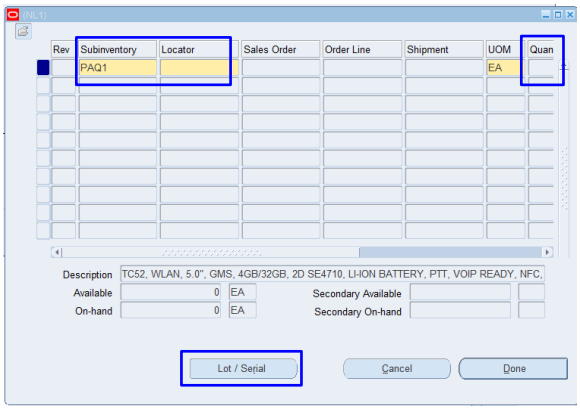
Enter the correct Organization and press 'OK'



Step 2: Enter the Job number
(The job number will be advised by the Planning Team/Buyer or can be found on the GTM Form associated with the OSP Job)
And click 'Continue'

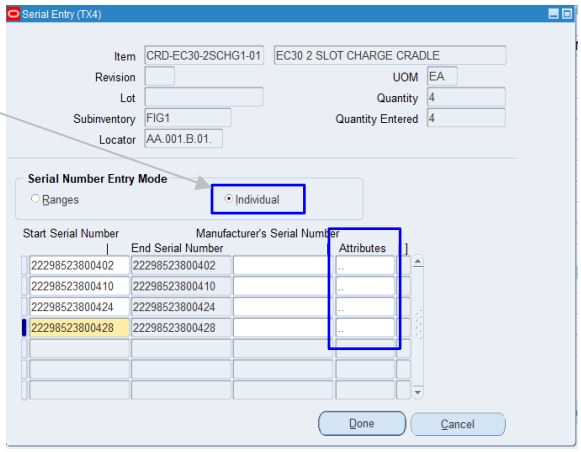
Step 3: Enter the following details:

- Subinventory: for example 'PAQ1'
- Locator: for example 'AA.000.Q.00.'
- Quantity: this is the reworked quantity for the Job, so the quantity received from the Supplier

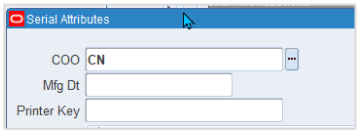


Usually the assembly items are serial-controlled, then click on the 'Lot-Serial' button and enter the Serial Numbers using the Serial Number 'Individual' Entry Mode

Note:
The item is different in screenshot below



It is important to also fill in the Country of Origin in the 'Attributes' field



Click on 'Done' when all Serial Numbers have been captured

The screen will go back - click on 'Done' again

Note: If the OSP job is for a large quantity, then entering the Serial Numbers is much faster using the 'Data Loader' tool. How to use the 'Data Loader' tool is described in a separate work instruction.

The WIP Completions are done, the items can now be packed onto an LPN and can be moved to inventory.
