WIP JOB ALERTS

There are a few scheduled checks that validate the WIP Job Assembly Completion transactions. When a specific error is detected, an alert will be generated and e-mailed to the employees identified as recipients for that alert.

To resolve these errors, please follow the instructions below.

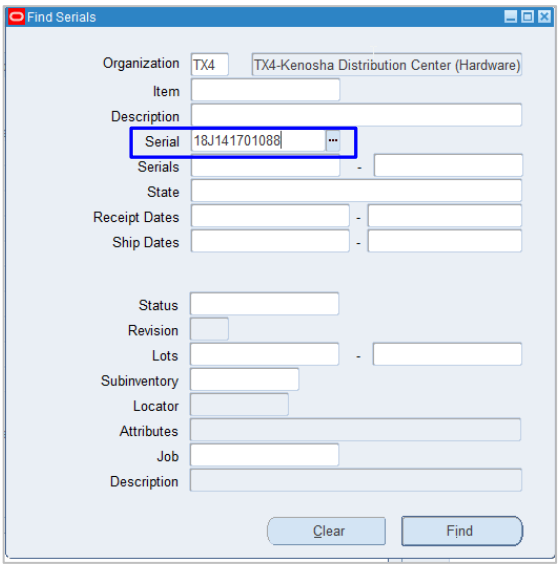
Alert: 'Base Printer SN Attributes Not Set'

```
Org :NL1
WIP Job :3607
Parent SN :08J110301231
Base Printer SN :08J110301231
Reason :"Base Printer SN Attributes Not Set / Base Printer Could not be identified"
Transaction Date :30-MAR-11
Session User :SHOEKSMA
```

When an Assembly is completed the Country of Origin and Manufacturing Date are automatically transferred from the base printer (in the background). It can however occasionally happen that the Country of Origin and/or Manufacturing Date is missing for a Serial Number. In those cases, this alert will be triggered, so that the Serial Number attributes can be updated.

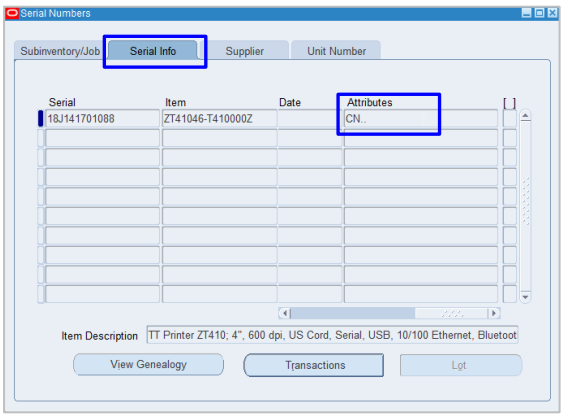
Step 1: Using Oracle Forms, navigate to 'Inventory Management' -> 'Material Maintenance' -> 'Maintain Serial Numbers'

Step 2: Enter the Serial Number from the alert and click on 'Find'



Step 3: Select the 'Serial Info' tab and scroll to the right

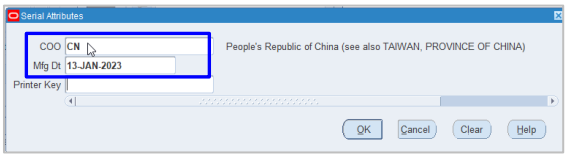
Click in the 'Attributes' field



Step 4: Update the Country of Origin and/or Manufacturing Date

Click on 'OK'

Click on the 'Save' icon in the toolbar



The attributes for the Serial Number have been updated

Alert: 'Printer not re-serialized'

Org :NL1
WIP Job :472393
Assembly : ZT23043-T2E200FZ
Parent SN :52J190200091
Base Printer SN :52J190200091
Reason :"Printer not re-serialized"
Transaction Date :05/16/2019
Session User :PW7991

For specific WIP Jobs it is required that the printers get a new Serial Number upon Assembly Completion. In those cases the 'Re-serialization' option is activated against the WIP Job and the newly assigned Serial Numbers will be printed on the Travelers. It can however occasionally happen that the re-serialization option is missed and that the new Assemblies are created using the original component Serial Numbers. In those cases, this alert will be triggered, so that the Assembly Completions can be corrected.

Notes:

- *The following steps must be executed by a Super User (using the 'ZTC Reconfiguration Super User' responsibility).*
- *For this Work Instruction it is assumed that the Super User knows how to do an Assembly Completion and Return*

Step 1: Perform a 'WIP Completion Return' using the Assemblies with the incorrect Serial Numbers

Step 2: Perform the 'WIP Completions' again, now using the newly assigned Serial Numbers

The Assemblies are re-generated with the correct, new Serial Numbers
